16. ABSTRACT

Annual total phosphorus and total nitrogen loadings to the lake were estimated and subdivided according to either point or non-point source origin. An assessment of the lake's trophic condition and limiting nutrient is also provided. All data collected by the U.S.E.P.A. National Eutrophication Survey during the one year study of the lake and its tributaries are included in the report.

FOREWORD

The National Eutrophication Survey was initiated in 1972 in response to an Administration commitment to investigate the nationwide threat of accelerated eutrophication to fresh water lakes and reservoirs.

OBJECTIVES

The Survey was designed to develop, in conjunction with state environmental agencies, information on nutrient sources, concentrations, and impact on selected freshwater lakes as a basis for formulating comprehensive and coordinated national, regional, and state management practices relating to point-source discharge reduction and non-point source pollution abatement in lake watersheds.

ANALYTIC APPROACH

The mathematical and statistical procedures selected for the Survey's eutrophication analysis are based on related concepts that:

a. A generalized representation or model relating sources, concentrations, and impacts can be constructed.

b. By applying measurements of relevant parameters associated with lake degradation, the generalized model can be transformed into an operational representation of a lake, its drainage basin, and related nutrients.

c. With such a transformation, an assessment of the potential for eutrophication control can be made.

LAKE ANALYSIS

In this report, the first stage of evaluation of lake and watershed data collected from the study lake and its drainage basin is documented. The report is formatted to provide state environmental agencies with specific information for basin planning {§303(e)}, water quality criteria/standards review {§303(c)}, clean lakes {§314(a,b)}, and water quality monitoring {§106 and §305(b)} activities mandated by the Federal Water Pollution Control Act Amendments of 1972.

Beyond the single lake analysis, broader based correlations between nutrient concentrations (and loading) and trophic condition are being made to advance the rationale and data base for refinement of nutrient water quality criteria for the Nation's fresh water lakes. Likewise, multivariate evaluations for the relationships between land use, nutrient export, and trophic condition, by lake class or use, are being developed to assist in the formulation of planning guidelines and policies by EPA and to augment plans implementation by the states.

ACKNOWLEDGMENT

The staff of the National Eutrophication Survey (Office of Research & Development, U. S. Environmental Protection Agency) expresses sincere appreciation to the Indiana State Board of Health for professional involvement, to the Indiana National Guard for conducting the tributary sampling phase of the Survey, and to those Indiana wastewater treatment plant operators who provided effluent samples and flow data.

The staff of the Division of Water Pollution Control, Indiana State Board of Health, provided invaluable lake documentation and counsel during the Survey, reviewed the preliminary reports, and provided critiques most useful in the preparation of this Working Paper series.

Major General Alfred F. Ahner, Adjutant General of Indiana, and Project Officers Lt. Colonel Charles B. Roberts (Retired) and Colonel Robert L. Sharp, who directed the volunteer efforts of the Indiana National Guardsmen, are also gratefully acknowledged for their assistance to the Survey.

BASS LAKE

STORET NO. 1851

I. CONCLUSIONS

A. Trophic Condition:

Survey data indicate that Bass Lake is eutrophic. It ranked twelfth in overall trophic condition when the 27 Indiana lakes sampled in 1973 were compared using a combination of six parameters*. Fifteen of the lakes had less median total phosphorus, 14 had less and one had the same median dissolved phosphorus, six had less median inorganic nitrogen, 20 had less mean chlorophyll a, and 21 had greater mean Secchi disc transparency.

B. Rate-Limiting Nutrient:

The algal assay results indicate that Bass Lake was phosphorus limited at the time the sample was collected (05/02/73). The lake data indicate phosphorus limitation in August as well but marginal nitrogen limitation in October.

C. Nutrient Controllability:

1. Point sources--No known municipal or industrial point sources impacted Bass Lake during the sampling year. Lakeshore septic tanks were estimated to have contributed 23.7% of the total load reaching the lake, but a shoreline survey would be necessary to determine the significance of those sources.

* See Appendix A.

The present phosphorus loading of 0.09 $g/m^2/yr$ is less than that proposed by Vollenweider (Vollenweider and Dillon, 1974) as a eutrophic loading (see page 11).

The trophic condition of the lake at this time may be the result of greater nutrient loadings in the past. For example, since the phosphorus ban was instituted in January, 1972, there was an estimated decrease in domestic wastewater phosphorus of about 50%. In other words, the 115 kg P/yr now estimated to have come from septic tanks (see page 9) would have been about 230 kg P/yr before the ban. The total phosphorus loading rate prior to the 1972 ban (assuming no other changes have taken place in phosphorus loading) is estimated at 600 kg P/yr (0.11 $g/m^2/yr$); i.e., 19% greater than the present load.

With a mean hydraulic retention time of three years, a lag time of several years would be expected before improvement in the quality of the lake becomes apparent.

2. Non-point sources--The phosphorus load from non-point sources was estimated to have been 76.3% of the total load during the sampling year. No gaged tributaries were sampled during the year; the ungaged tributaries were estimated to have contributed 55.7% of the total phosphorus load.

II. LAKE AND DRAINAGE BASIN CHARACTERISTICS†

A. Lake Morphometry††:

1. Surface area: 5.69 kilometers^2.
2. Mean depth: 1.8 meters.
3. Maximum depth: 9.8 meters.
4. Volume: 10.242 x 10^6 m^3.
5. Mean hydraulic retention time: 3.2 years.

B. Tributary and Outlet:
(See Appendix C for flow data)

1. Tributaries -

Name	Drainage area (km^2)*	Mean flow (m^3/sec)*
None sampled	-	-
Minor tributaries & immediate drainage -	7.7	0.10
Totals	7.7	0.10

2. Outlet -

Cedar Lake Ditch	13.4**	0.10

C. Precipitation***:

1. Year of sampling: 104.3 centimeters.
2. Mean annual: 92.6 centimeters.

III. LAKE WATER QUALITY SUMMARY

Bass Lake was sampled three times during the open-water season of 1973 by means of a pontoon-equipped Huey helicopter. Each time, samples for physical and chemical parameters usually were collected from two or more depths at three stations on the lake (see map, page v). During each visit, a single depth-integrated (near bottom to surface) sample was composited from the stations for phytoplankton identification and enumeration; and during the first visit, a single 18.9-liter depth-integrated sample was composited for algal assays. Also each time, a depth-integrated sample was collected from each of the stations for chlorophyll a analysis. The maximum depths sampled were 0.6 meters at station 1, 4.9 meters at station 2, and 2.1 meters at station 3.

The sampling results are presented in full in Appendix D and are summarized in the following table.

05/02/73	1	27.0
	2	27.7
	3	26.3
08/03/73	1	25.5
	2	33.7
	3	39.9
10/13/73	1	28.3
	2	26.8
	3	29.1

C. Limiting Nutrient Study:

1. Autoclaved, filtered, and nutrient spiked -

Spike (mg/l)	Ortho P Conc. (mg/l)	Inorganic N Conc. (mg/l)	Maximum yield (mg/l-dry wt.)
Control	0.030	0.856	8.3
0.050 P	0.080	0.856	21.6
0.050 P + 1.0 N	0.080	1.856	26.4
1.0 N	0.030	1.856	10.5

2. Discussion -

The control yield of the assay alga, Selenastrum capricornutum, indicates that the potential primary productivity of Bass Lake was high at the time the sample was collected (05/02/73). The results also indicate that Bass Lake was phosphorus limited at that time. Note that with the addition of nitrogen alone, the yield was not significantly greater than the control yield; however, with the addition of orthophosphorus, a marked increase in yield occurred.

The lake data indicate phosphorus limitation in August as well (the mean inorganic nitrogen/orthophosphorus ratio was 32/1) but marginal nitrogen limitation in October (the mean N/P ratio was nearly 13/1).

IV. NUTRIENT LOADINGS
(See Appendix E for data)

For the determination of nutrient loadings, the Indiana National Guard collected monthly near-surface grab samples from the outlet site indicated on the map (page v), except for the high runoff months of February and March when two samples were collected. Sampling was begun in June, 1973, and was completed in May, 1974.

Through an interagency agreement, stream flow estimates for the year of sampling and a "normalized" or average year were provided by the Indiana District Office of the U.S. Geological Survey for the outlet and minor tributaries and immediate drainage.

In this report, outlet nutrient loads were determined by using a modification of a U.S. Geological Survey computer program for calculating stream loadings*.

Nutrient loadings for unsampled "minor tributaries and immediate drainage" ("ZZ" of U.S.G.S.) were estimated using the means of the nutrient loads, in $kg/km^2/year$, at stations A-2, B-1, and C-1 of nearby Lake Maxinkuckee** and multiplying the means by the Bass Lake ZZ area in km^2.

2. Outputs -

Lake outlet - Cedar Lake Ditch 10,725

3. Net annual N accumulation - 8,155 kg.

* Estimate based on 398 lakeshore dwellings; see Working Paper No. 175.
** See Working Paper No. 175.

D. Yearly Loads:

In the following table, the existing phosphorus loadings are compared to those proposed by Vollenweider (Vollenweider and Dillon, 1974). Essentially, his "dangerous" loading is one at which the receiving water would become eutrophic or remain eutrophic; his "permissible" loading is that which would result in the receiving water remaining oligotrophic or becoming oligotrophic if morphometry permitted. A mesotrophic loading would be considered one between "dangerous" and "permissible".

Note that Vollenweider's model may not be applicable to water bodies with short hydraulic retention times.

	Total Phosphorus		Total Nitrogen	
	Total	Accumulated	Total	Accumulated
grams/m^2/yr	0.09	0.04	3.3	1.4

Vollenweider phosphorus loadings ($g/m^2/yr$) based on mean depth and mean hydraulic retention time of Bass Lake:	
"Dangerous" (eutrophic loading)	0.14
"Permissible" (oligotrophic loading)	0.07
